

Wasp Wildfire Protection Kits

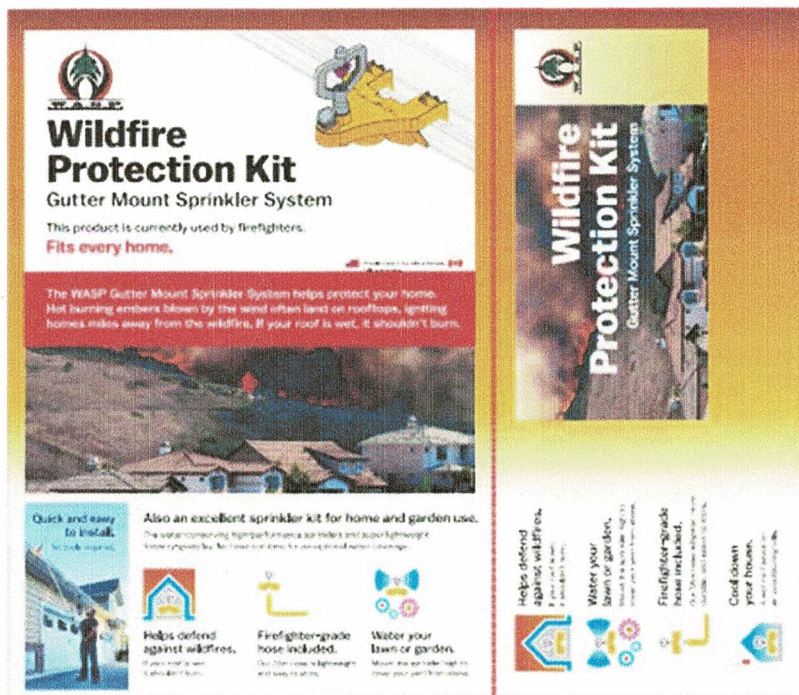

Community Program 2021

Most Houses Lost to Wildfire are Over a Kilometer from the Fire Line!

Many structures burn from the roof down, caused by windblown embers prevalent during wildfire emergencies. Wasp patented products help protect homes by easily getting water to the roof tops where needed most to protect the house. If it's wet, it shouldn't burn.

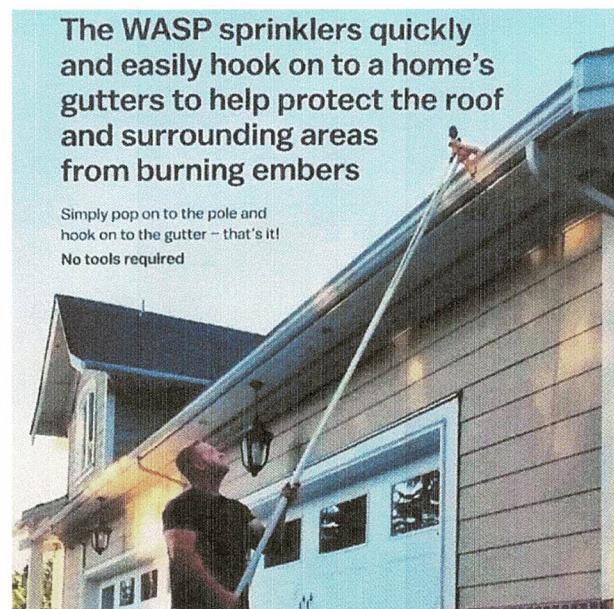

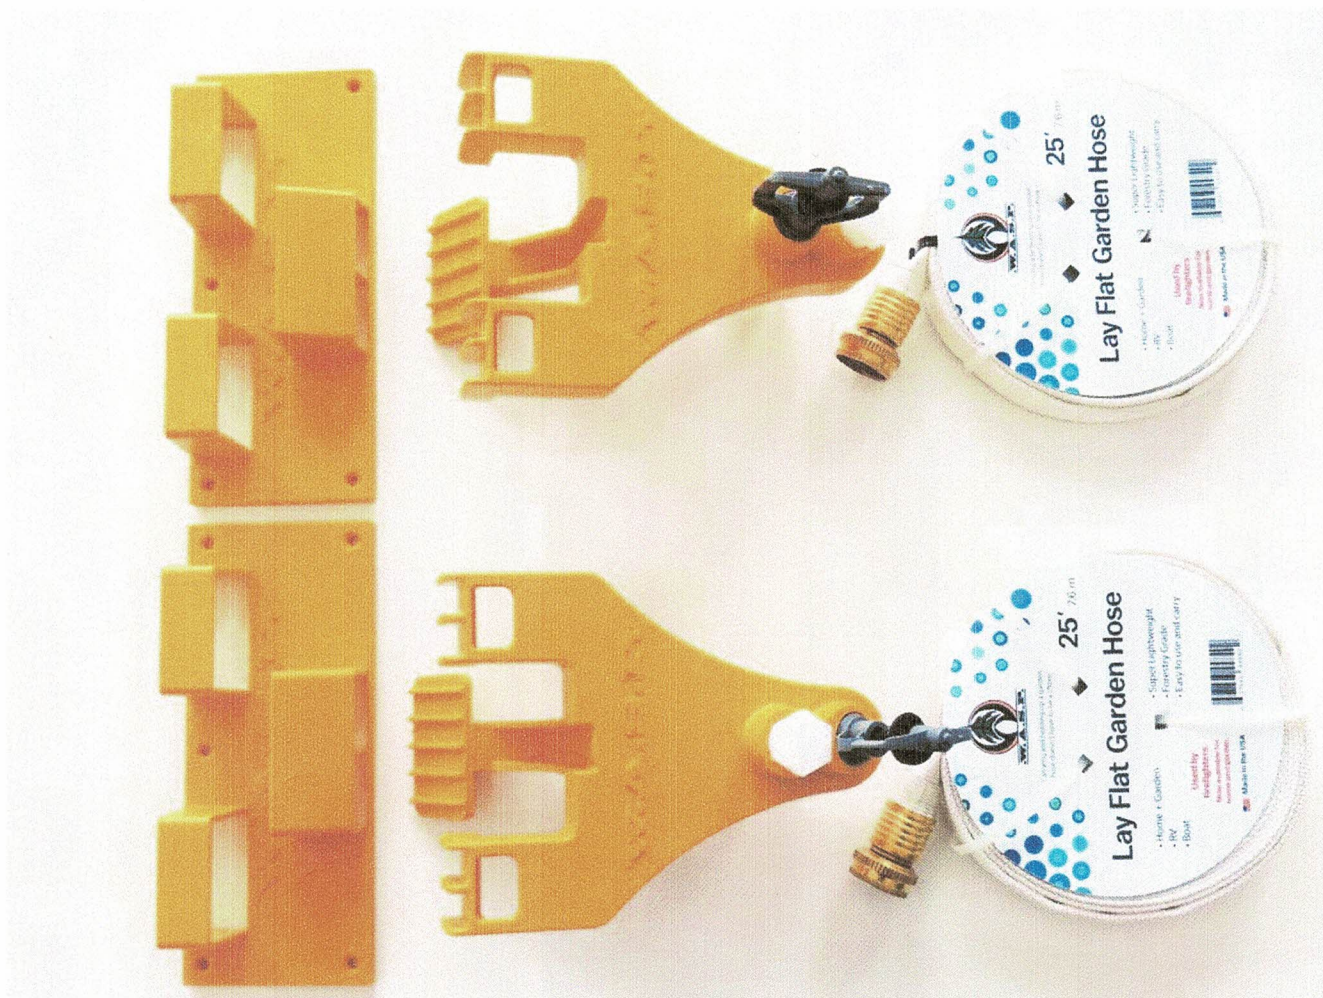

Wasp is a trusted manufacturer of sprinkler equipment sold to fire departments throughout North America and now South Africa.

Dramatic increases in wildfire incidents are causing widespread destruction and putting family homes in danger, opening retail markets to emergency preparedness products.

Wildfire conditions create high winds which carry burning embers kilometers away from the scene of the fire.

- A home can easily burn from the roof down after being ignited by a single fiery ember.
- The Wasp Wildfire Protection Kits provide a simple and effective way to get water to the rooftops of houses during wildfire emergencies.
- The 360-degree continuous spray of the gutter mount sprinklers wets the roof and surrounding areas to help defend the home against the wildfire threat and burning embers.
- Easy to deploy; a child or senior can easily attach the sprinkler to the gutter of a home in seconds with any household painting pole or even a broom handle. **Pole not included.**
- No ladders or tools required.
- The Full Kit (box front and side shown above) comes complete with everything needed to help protect a standard sized home from wildfire.
- The brackets are designed and tested to connect to over 95% of gutters. All kits contain Wasp fence/fascia brackets, which allow for quick one-time installation on structures without gutters.
- Great also as sprinklers for general home and garden use! Sprinklers conserve water compared to standard home sprinklers, rated at only 2.5usg per minute!**

\$199.95

Each Full Kit (shown above comes complete with everything needed to help protect a standard sized house from wildfire. Included are: 2 agricultural grade sprinkler heads designed to conserve water and work on very low pressure if required, 2 patent pending gutter mount brackets, 2 fence/fascia brackets, all required standard garden hose fittings and connections and 2 x 7.6m lengths of forestry grade lay flat hose. This is the same hose Wasp sells to fire departments for this type of application.

Each bracket is easily adjustable for steep roof pitches. Simply unscrew the sprinkler head from the standard vertical connection and move it to the forward position, which provides more than enough spray angle to reach the peak of any A-frame designed structure.

All connections are designed to be hand tightened with no tools required for assembly

The Company

Wasp Manufacturing Ltd. is a Canadian company based in British Columbia, the heart of wildfire country in North America. Wasp heavy duty fire equipment has been used extensively fighting wildfires in Western Canada and is trusted by firefighters throughout North America. Wasp is a member of the British Columbia Association of Fire Chiefs, the National Fire Protection Association and is registered for product development with the National Research Council of Canada.
